App overview

Med Med

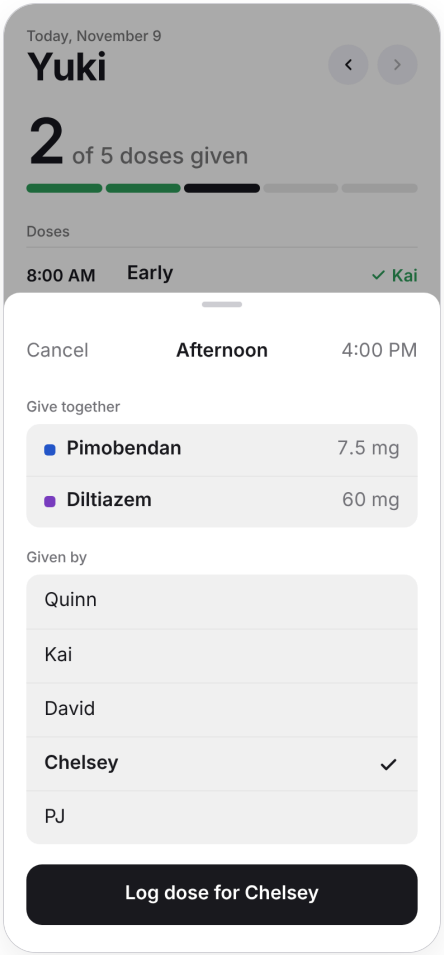

Yuki's heart meds, logged by whoever gives them.

Med Med replaces the paper sheet on the fridge for Yuki's four heart medications. Five doses a day are split across the household, so the app shows **what's due, who gave each dose and when**, and keeps every phone on the same shared log. If a dose goes unlogged, everyone gets an alert. It still prints the paper sheet for the fridge, and it installs on an iPhone or iPad Home Screen like a normal app.

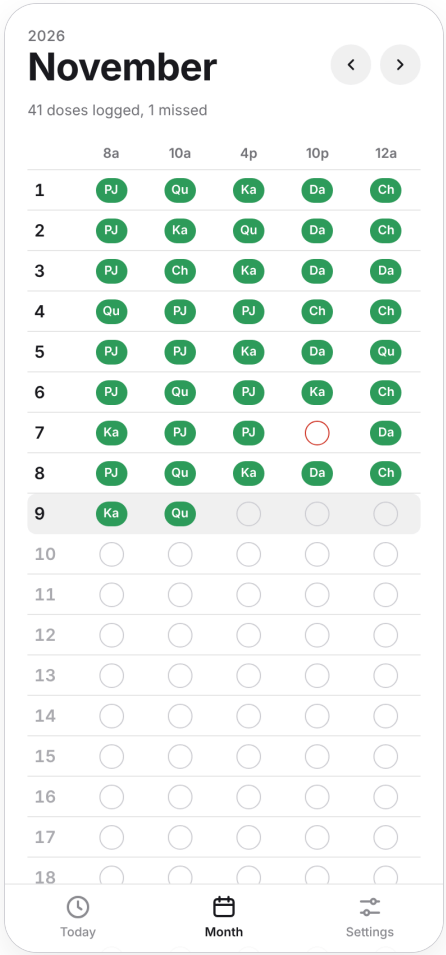

Today

The day's five doses with their meds. Given doses show who and when, the next one shows Log, and late ones turn red.

Log a dose

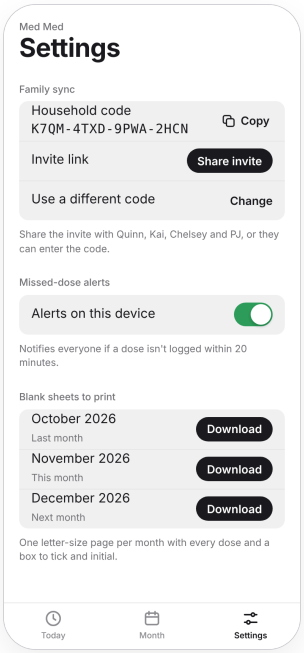

Tap a dose, pick who gave it and tap Log. Each phone remembers the last name used. Mistakes can be changed or cleared.

Month

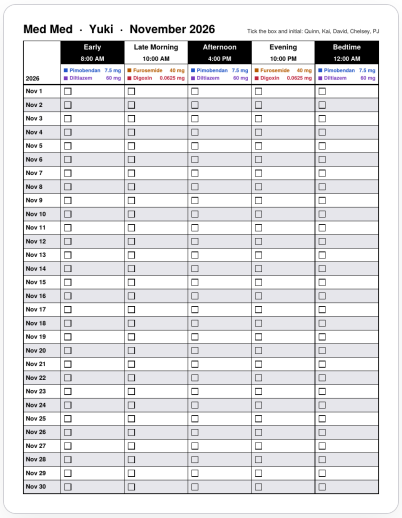

Every dose for the month in one grid, with the giver's initials in green and missed doses as red rings. Tap a day to open it.

5	4	5	~20 min
doses a day, 8 AM to midnight	meds, each with its own colour	people on one shared log	after a missed dose, everyone is alerted

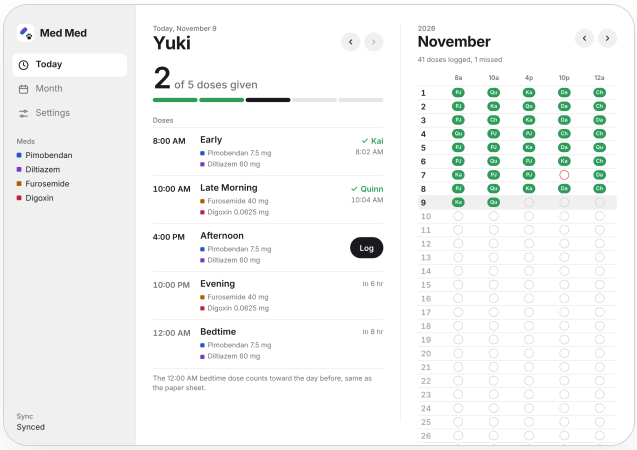

Settings

Household code with Copy, the invite link, the alerts switch and blank sheets.

Printable sheet

One letter page per month, matching the paper sheet, with a box to tick and initial.

iPad, sideways

A sidebar with the med key and sync status, with today and the whole month side by side. Phones and portrait keep the tab layout.

The schedule

Early 8:00 AM, Late Morning 10:00 AM, Afternoon 4:00 PM, Evening 10:00 PM and Bedtime 12:00 AM. The midnight dose counts toward the day before, as on the paper sheet.

- Pimobendan 7.5 mg
- Diltiazem 60 mg
- Furosemide 40 mg
- Digoxin 0.0625 mg

Family sync

Everyone shares one log through a private household code. The first phone starts the log and the rest join by opening the invite link or typing the code. A dose logged on one phone shows on the others within seconds.

Privacy and security

No accounts or passwords. The log can only be read or changed with the household code, and database rules limit what can be written. Anyone holding the invite link can edit the log, so it stays in the family. If it leaks, Change starts a new code.

Known limits

Alerts can arrive up to about 45 minutes after a dose was due, because GitHub's scheduler isn't exact. Screen rotation has to be locked with the iPad's own Rotation Lock. Changing a dose time means editing the schedule in the app and in the alert checker.

Due and missed

A dose shows Log from half an hour before its time. Two hours after, it turns red as Missed, and any blank dose on an earlier day counts as missed. Missed doses can still be logged late.

Missed-dose alerts

About 20 minutes after an unlogged dose, every phone with alerts on gets one notification, and tapping it opens Today. On iPhone and iPad alerts work from the Home Screen icon. Each device turns them on with the switch in Settings.

How it runs

A single web page on GitHub Pages, installable to the Home Screen with the capsule and paw icon. The log lives in Firebase's free tier in Toronto, and a free GitHub job checks for missed doses every 15 minutes. It follows the device's dark mode and ignores pinch and double-tap zoom.

Paper sheets

Settings offers last month, this month and next month as PDFs with alternating black and white time bands. Past paper sheets can be photographed and imported into the log, with each dose at its scheduled time.
