Med Med

Yuki's daily heart medicine, logged by the whole family.

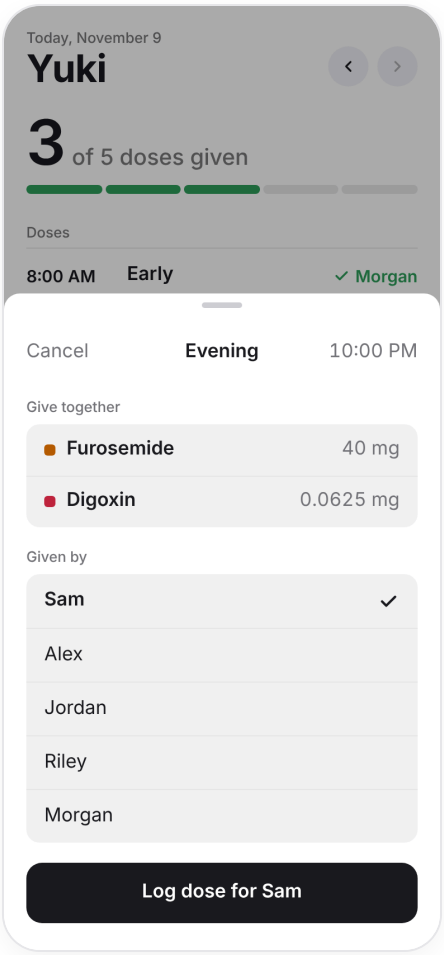

Yuki takes heart medicine five times a day. Med Med shows **what's due next**, lets whoever gives a dose log it with two taps, and keeps **everyone's phone on the same log**, so nobody doubles a dose or misses one. The month view shows every dose at a glance, and blank sheets print for the fridge.

Pimobendan · Diltiazem · Furosemide · Digoxin

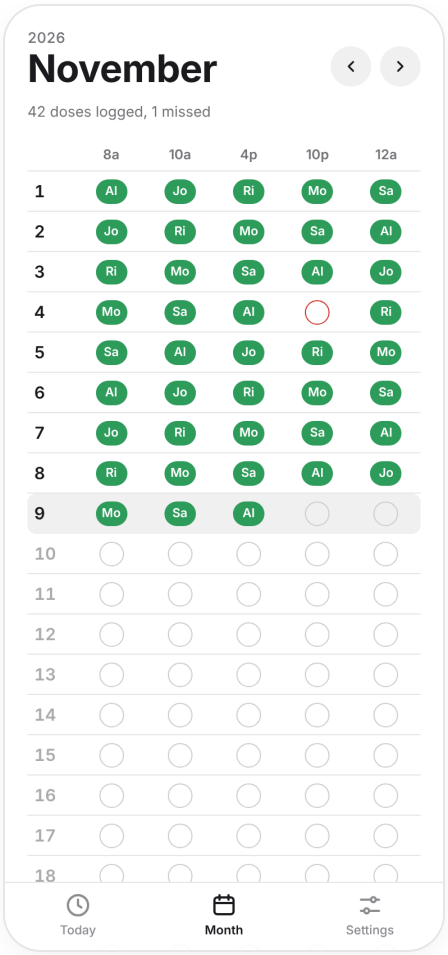

Today

Five doses with their medicines, who gave each one and when, and what's coming up.

Log a dose

Tap a dose, confirm who's giving it, done. The last person to give one is picked for you.

Month

Every day and dose on one screen, with initials for who gave it and a red ring for a miss.

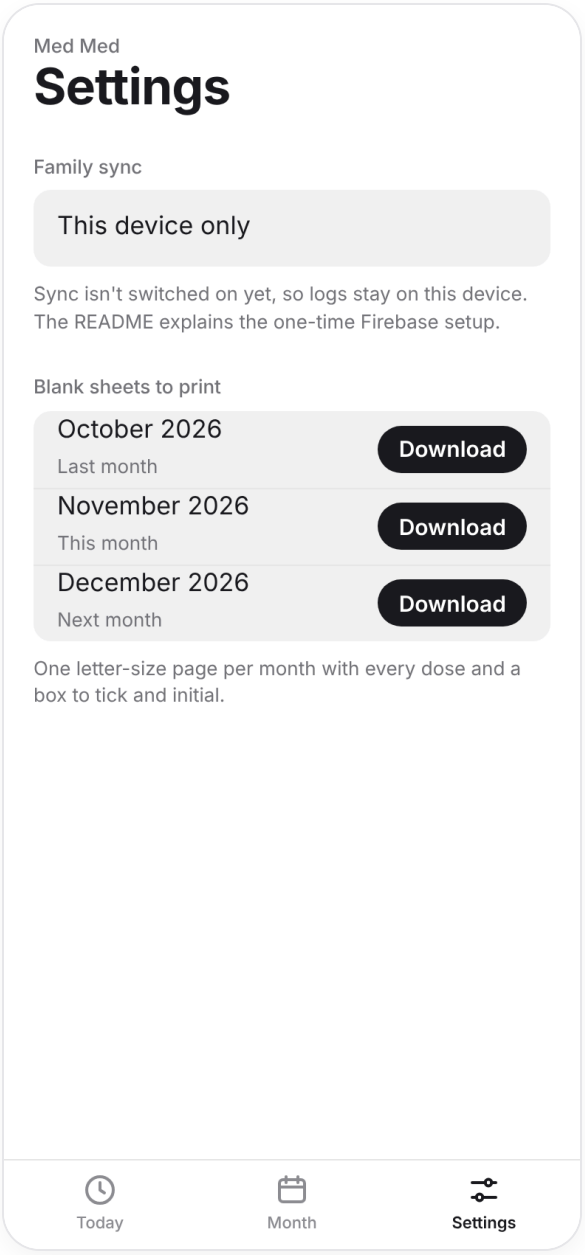

AT A GLANCE

5
doses a day, 8 am to midnight

4
medicines, each with its own colour

2 taps
to log a dose

20 min
after a missed dose, every phone with alerts on hears about it

Settings
Family sync, alerts, and blank sheets to print for last month, this month and next.

One log for the family

Starting the log makes a private household code. Share the invite link once and every phone that opens it sees and updates the same log, live. If a link ever leaks, start a new log and re-invite.

Missed-dose alerts

If a dose isn't logged about 20 minutes after it's due, every phone that turned alerts on gets a notification. A check runs every 15 minutes, so an alert can take up to about half an hour.

Printable sheets

One Letter page per month, with every dose, a box to tick and room for initials, for days when a paper sheet on the fridge is easier.

Matches the paper routine

The midnight dose counts toward the day before, the same way the paper sheet does, so the app and the fridge never disagree.

Like an app

Add it to the Home Screen and it opens full screen with its own icon, in light or dark mode.

Private

The log holds only dose times and first names. The database only lets in phones that have the household code.

How it runs

A single web page on GitHub Pages. Family sync uses Firebase's free tier, and the missed-dose check runs as a free GitHub Action. Without sync, each phone keeps its own log.
