App overview

Med Med

Yuki's heart meds, logged by whoever gives them.

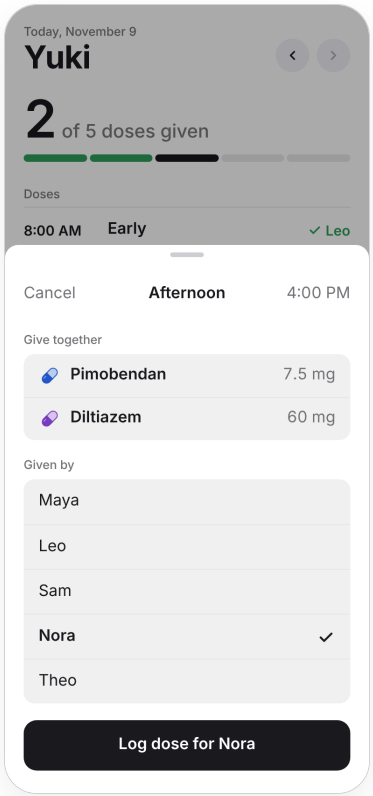

App version 2026.11.13 · Document version 2.5

Med Med replaces the paper sheet on the fridge for Yuki's four heart medications. Five doses a day are split across the household, so the app shows **what's due, who gave each dose and when**, keeps every phone on one shared log and alerts everyone when a dose is missed. It still prints the paper sheet, and installs on the Home Screen like a normal app.

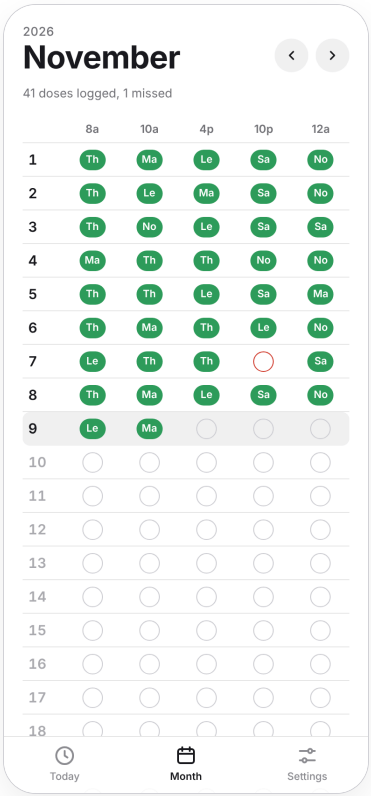

Today

The day's five doses with their meds. Given doses show who and when, the next one shows Log, and late ones turn red.

Log a dose

Tap a dose, pick who gave it and tap Log. Each phone remembers the last name used. Mistakes can be changed or cleared.

Month

Every dose for the month in one grid, with the giver's initials in green and missed doses as red rings. Tap a day to open it.

5	4	5	~20 min
doses a day, 8 AM to midnight	meds, each with its own colour of capsule	people on one shared log	after a missed dose, everyone is alerted

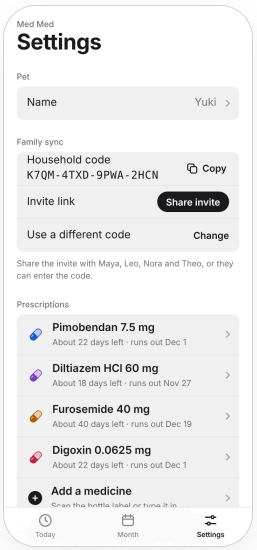

The schedule

Early 8:00 AM, Late Morning 10:00 AM, Afternoon 4:00 PM, Evening 10:00 PM and Bedtime 12:00 AM. The midnight dose counts toward the day before, as on the paper sheet.

- Pimobendan 7.5 mg
- Diltiazem 60 mg
- Furosemide 40 mg
- Digoxin 0.0625 mg

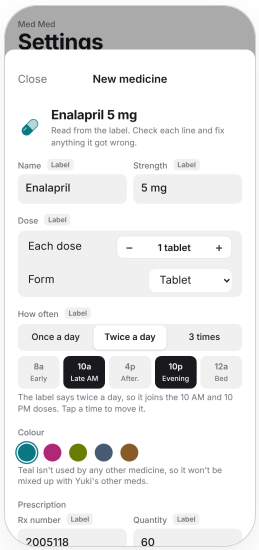

Due and missed

A dose shows Log from half an hour before its time and turns red as Missed two hours after. Missed doses can still be logged late.

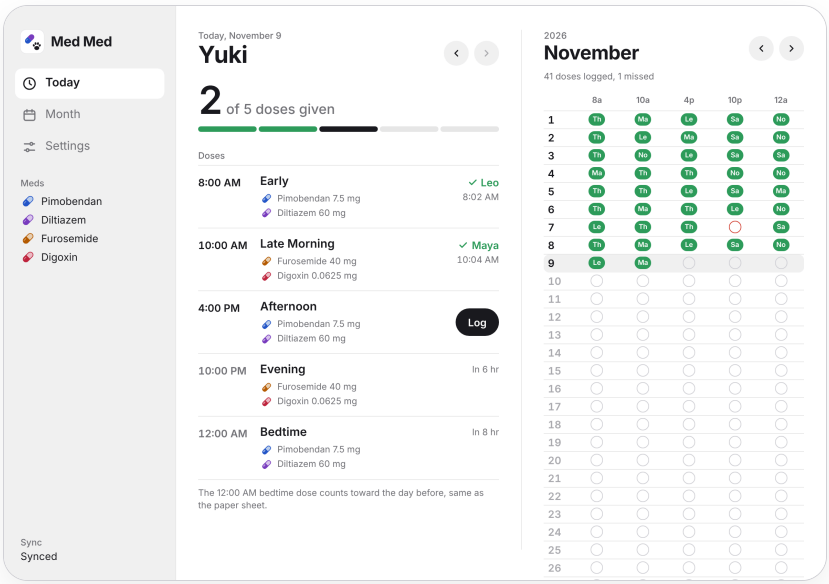

Settings

The pet's name, prescriptions, household code, invite, sound, screen and alert switches, and blank sheets.

Add a medicine

Scan the bottle's label, check what it read, set the dose and times. It gets a colour of its own.

iPad, sideways

A sidebar with the med key and sync status, and today beside the whole month. Phones and portrait keep the tabs.

Family sync

One log shared through a private household code. Others join with the invite link or the code, and a dose logged on one phone shows on the rest within seconds. Renaming the pet in Settings changes it for everyone.

Sounds

Logging a dose plays a short ding. One dose each day gets a real bark instead, the same dose on every phone. Sounds follow the silent switch and can be turned off in Settings.

Prescriptions and refills

Each medicine keeps its Rx number, pharmacy, quantity, refills left and last fill. Days left turn red at ten. A new medicine is added by photographing its label, read on the phone, then joins Today, the sheets and refills.

How it runs

A web app on GitHub Pages that installs to the Home Screen with the capsule and paw icon. It follows the device's dark mode, works offline and catches up when it reconnects. Details are on the Technical setup page.

Missed-dose alerts

About 20 minutes after an unlogged dose, every phone with alerts on gets one notification. On iPhone and iPad they work from the Home Screen icon, switched on in Settings.

Privacy and security

No accounts or passwords. The log can only be read or changed with the household code, so the invite stays in the family. If it leaks, Change starts a new code.

Paper sheets

Settings offers last month, this month and next month as letter PDFs with alternating black and white time bands. Filled-in sheets can be photographed and imported into the log, each dose at its scheduled time.

Known limits

Alerts land 20 to 30 minutes after a missed dose, since the log is checked every 10 minutes. Phones held sideways get a two-column layout, which Settings can turn off; only the device's Rotation Lock stops the screen turning. Pinch and double-tap zoom are off.

Technical setup

Sources and libraries

Source	Version	What it does	Loaded from	Licence
Med Med code	2026.11.13	App, service worker, icons and alert checker	`index.html`, `sw.js`, `icons/`, `scripts/`	Own
Firebase JS SDK	10.12.2	Anonymous sign-in and Firestore with offline cache	`www.gstatic.com/firebasejs`	Apache 2.0
jsPDF	2.5.1	Draws the blank monthly sheets on the device	`cdnjs.cloudflare.com`	MIT
Tesseract.js	5.1.1	Reads label photos on the phone when scanning	`cdn.jsdelivr.net`	Apache 2.0
Bark recording	"Dog barking mono"	The daily woof (the ding is made in code)	Brandon Morris on OpenGameArt, `sounds/woof.mp3`	CC0
pywebpush	2.0.3	Encrypts and signs Web Push messages	PyPI, on the GitHub runner	MPL 2.0
Python, Actions	3.12; v4, v5	Runs the alert checker (checkout, setup-python, cache)	GitHub runner and Marketplace	PSF, MIT
Playwright	installed	This document's screenshots and PDF	`docs/overview`	Apache 2.0

Integrations · no keys or secrets shown

Service	Used for	Details
Firebase Firestore	The shared dose log	Free plan, Toronto. Under `households/<code>`: `days` (doses), `meds` (prescriptions, added medicines, pet's name), `subs` (push addresses), `alerts`. Rules check every write.
Firebase Auth	Access to the log	Anonymous sign-in, no accounts. Access also needs the household code.
GitHub Pages	Hosting	Serves the public `med-med` repo as a static site.
GitHub Actions	Alert checker	`missed-dose-alerts.yml` reads Firestore over REST. Secrets `HOUSEHOLD_CODE` and `VAPID_PRIVATE_KEY` live in Actions secrets.
cron-job.org	Starting the checker	"Med Med alerts" POSTs to GitHub's workflow-dispatch API every 10 minutes with a token that can only start Actions on this repo.
Web Push	Missed-dose alerts	Apple's or Google's push service. Messages are encrypted, signed with a VAPID key, and carry only the dose name, time and meds.
Browser features	On each device	Local storage, the camera or photo picker for labels, Web Audio for the ding and woof, service worker, Push and Notifications, clipboard and share sheet, web manifest for Home Screen install.

What runs where

On the device
The app, label reading, the printable sheets and an offline copy of the log that syncs when the connection returns.

Network calls
The script CDNs (jsDelivr only when scanning a label), Firebase Auth and Firestore, and the device's push service. No analytics or tracking.

Data kept
Log, prescriptions and alert data in Firestore; the code and preferences on each device; secrets in GitHub and cron-job.org.

Regenerating this document
From the repo root run `node docs/overview/shoot.js`, then `pdf.js`. Sample data only.
