App overview

Med Med

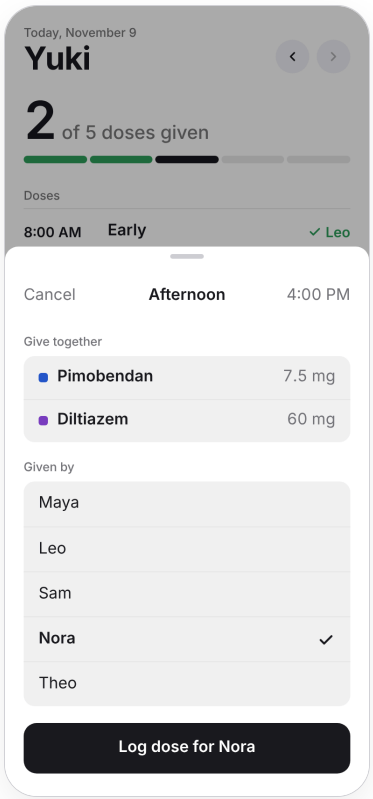

Yuki's heart meds, logged by whoever gives them.

Med Med replaces the paper sheet on the fridge for Yuki's four heart medications. Five doses a day are split across the household, so the app shows **what's due, who gave each dose and when**, keeps every phone on one shared log and alerts everyone when a dose is missed. It still prints the paper sheet, and installs on the Home Screen like a normal app.

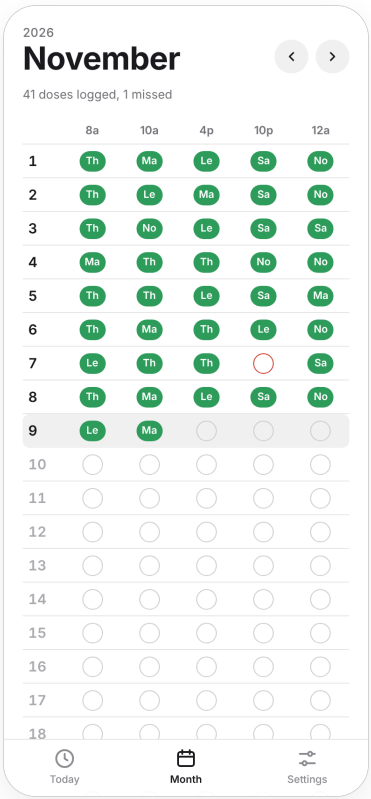

Today

The day's five doses with their meds. Given doses show who and when, the next one shows Log, and late ones turn red.

Log a dose

Tap a dose, pick who gave it and tap Log. Each phone remembers the last name used. Mistakes can be changed or cleared.

Month

Every dose for the month in one grid, with the giver's initials in green and missed doses as red rings. Tap a day to open it.

5	4	5	~20 min
doses a day, 8 AM to midnight	meds, each with its own colour	people on one shared log	after a missed dose, everyone is alerted

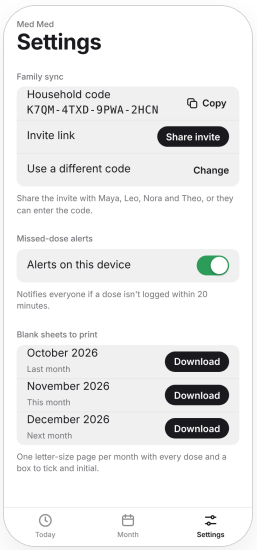

The schedule

Early 8:00 AM, Late Morning 10:00 AM, Afternoon 4:00 PM, Evening 10:00 PM and Bedtime 12:00 AM. The midnight dose counts toward the day before, as on the paper sheet.

- Pimobendan 7.5 mg
- Diltiazem 60 mg
- Furosemide 40 mg
- Digoxin 0.0625 mg

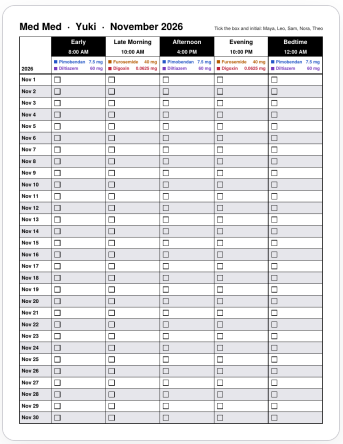

Due and missed

A dose shows Log from half an hour before its time and turns red as Missed two hours after. Missed doses can still be logged late.

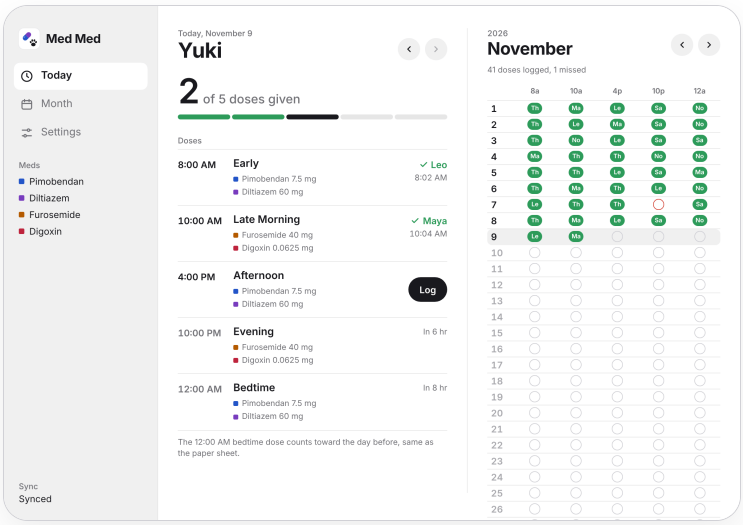

Settings

Household code, invite, alerts switch and blank sheets.

Printable sheet

One letter page per month with a box to tick and initial. Filled-in sheets can be photographed and imported.

iPad, sideways

A sidebar with the med key and sync status, and today beside the whole month. Phones and portrait keep the tabs.

Family sync

One log shared through a private household code. Others join with the invite link or the code, and a dose logged on one phone shows on the rest within seconds.

Missed-dose alerts

About 20 minutes after an unlogged dose, every phone with alerts on gets one notification. On iPhone and iPad they work from the Home Screen icon, switched on in Settings.

Privacy and security

No accounts or passwords. The log can only be read or changed with the household code, so the invite stays in the family. If it leaks, Change starts a new code.

Known limits

Alerts can arrive up to about 45 minutes late because GitHub's scheduler isn't exact. Rotation is locked with the iPad's own Rotation Lock. Pinch and double-tap zoom are off.

Technical setup

Hosting	GitHub Pages, public `med-med` repo: `index.html`, web manifest and icons, `sw.js` for notifications.
Shared log	Firebase Cloud Firestore, free Spark plan, Toronto region. `households/<code>/days` holds one document per day; `subs` and `alerts` serve the alerts.
Sign-in and rules	Firebase anonymous sign-in. `firestore.rules` limits access to household paths and checks every document.
Alert checker	GitHub Actions, every 15 minutes: `scripts/check_missed.py` reads Firestore over REST and sends Web Push (`pywebpush`, VAPID).
Secrets	`HOUSEHOLD_CODE` and `VAPID_PRIVATE_KEY` in GitHub secrets; `firebase-config.js` is public by design.
Libraries	Firebase JS SDK 10.12.2, jsPDF 2.5.1 for the sheets. No build step.
This document	`docs/overview`, regenerated with Playwright from sample data.
